The Correlation between Talent and Academic Achievement of
Universitas Advent Indonesia Students Batch 2016

Albinur Limbong and Horasdia Saragih
Universitas Advent Indonesia

Abstract

The purpose of this study was to compare students’ academic performance between those justified as talented or not talented in the study program that they chose. The population of the study was the new students of batch 2016. However, not all students join the talent test, only 384. The talent test was conducted by a professional talent test institution, while the academic achievement was based on the average GPA for the first and second semesters. The talent test result is classified into three parts, namely recommended, doubted, and not recommended. Based on the talent test, there were 365 candidate students recommended to take the study programs that they chose, 17 of those were doubted and only 2 of those were not recommended. Based on the talent test, the students were asked to determine their choice before taking any courses. Most of the students chose the program for the first time, some students changed their mind and moved to another study program within UNAI, and only few students changed their mind and did not enroll in UNAI at all. The study showed that the correlation coefficient between the talent test result and the academic result was low, with a correlation coefficient \((r)\) of 0.125. Based on the ANOVA test, it was found that there is a difference in the academic achievement between students who were recommended, doubted or not recommended to take the courses that they chose. If the talent does not significantly correlate with the achievement, then it is interesting to study in future what other significant factors, besides the talent, that influence the academic achievement.

Keywords: talent, academic achievement
